

SCOPE CYCLING ATMOZ – TIRE PRESSURE CONTROL

Product Description

How the Scope Cycling Atmoz System works

The main working principle of the product is a tire pressure management system based on mechanical valves which regulates airflow between the air reservoir and the tubeless tire. Via the control buttons located on the handlebar, a wireless signal is sent to the system to control valves to deflate or inflate the tire – meaning the rider can change the tire pressure in real-time.

The system does not alter the structural integrity of the wheelset and does not contain any moving parts or compressors.

Commercial availability

The Scope Cycling Atmoz System can be ordered via the Scope Cycling website:
